PROBLEM TRUSS CONNECTED TO CATENARY CABLE

The system shown in the figure is made up of a catenary cable FG supported by a truss jointed at its left end. The parameter of the catenary is equal to 6 meters and its weight per unit of length is $1 \mathrm{kN} / \mathrm{m}$. Additionally, it is known that points $F$ and $G$ are at the same height, while the horizontal distance between them is 6 meters.

In the truss, A and D are pin supports. The height of points F and G is the same. The system is loaded by the set of forces listed on the figure. Every geometric measure is expressed in meters. With all this information, determine:
a) Maximum and minimum tension at the catenary cable.
b) Length of the catenary
c) Internal normal forces at stretches $\mathrm{AB}, \mathrm{BD}$, CD and CF.
d) Maximum value of continuous distributed load $q$ along stretch DF in order to avoid exceeding $1 \mathrm{kN} . \mathrm{m}$ bending moment at stretch BD.
e) Safety coefficient of the structure, considering that it is made up of a circular cross section of radius equal to 15 mm , and its material has a maximum allowable stress of 150 MPa for compressive and tensile state.

a) Reaction forces at the cable.

$\mathrm{a}=\frac{\mathrm{T}_{\mathrm{o}}}{\mathrm{p}} \rightarrow \mathrm{T}_{\mathrm{o}}=6.1=6 \mathrm{kN}$
$y=\operatorname{acosh}\left(\frac{x}{a}\right)=6 \cosh \left(\frac{3}{6}\right)=6.76 m$
$\mathbf{T}_{\text {max }}=\mathrm{p} . \mathrm{y}_{\text {max }}=6,76 \mathrm{kN}$
$\mathrm{T}_{\mathrm{y}}=\sqrt{\mathrm{T}_{\text {max }}^{2}-\mathrm{T}_{\mathrm{o}}^{2}} \cong \mathbf{3 , 1 1 k N}$
b) Length of the cable:
$\mathrm{s}=\sqrt{\mathrm{y}^{2}-\mathrm{a}^{2}}=3.11 \mathrm{~m}$
$\mathrm{s}_{\text {tot }}=2 . \mathrm{s}=6.22 \mathrm{~m}$
Verification of value $\mathrm{T}_{\mathrm{y}}$ and s :
$\mathrm{s}=\mathrm{a} \cdot \sinh \left(\frac{\mathrm{x}}{\mathrm{a}}\right)=6 \cdot \sinh \left(\frac{3}{6}\right) \cong 3.11 \mathrm{~m}$
$\mathrm{T}_{\mathrm{y}}=\frac{\mathrm{p} \cdot \mathrm{s}_{\text {tot }}}{2}=\frac{1 \mathrm{kN} / \mathrm{m} \cdot 6.76 \mathrm{~m}}{2} \cong 3.11 \mathrm{kN}$

## c) Method of the joints:

Node sequence: $F \rightarrow C \rightarrow B$

$\sum \mathrm{F}_{\mathrm{y}}=0 \rightarrow \frac{\sqrt{2}}{2} \mathrm{~N}_{\mathrm{CF}}-3,11=0 \rightarrow \mathbf{N}_{\mathrm{CF}}=\mathbf{4 , 4} \mathbf{k N}(\mathbf{T})$
$\sum \mathrm{F}_{\mathrm{X}}=0 \rightarrow \frac{\sqrt{2}}{2} \mathrm{~N}_{\mathrm{CF}}+\mathrm{N}_{\mathrm{EF}}=6 \rightarrow \mathrm{~N}_{\mathrm{EF}}=2.89 \mathrm{kN}(\mathrm{T})$
$\mathrm{N}_{\mathrm{EC}}=0 \mathrm{kN}$
$\mathrm{N}_{\mathrm{ED}}=\mathrm{N}_{\mathrm{EF}}=2.89 \mathrm{kN}(\mathrm{T})$

$\sum \mathrm{F}_{\mathrm{y}}=0 \rightarrow \frac{\sqrt{2}}{2} \mathrm{~N}_{\mathrm{CD}}+1+\frac{\sqrt{2}}{2} 4.4=0$
$\mathrm{N}_{\mathrm{CD}}=5.81 \mathrm{kN}(\mathrm{C})$
$\sum \mathrm{F}_{\mathrm{x}}=0 \rightarrow \frac{\sqrt{2}}{2} \mathrm{~N}_{\mathrm{CD}}-\mathrm{N}_{\mathrm{BC}}+\frac{\sqrt{2}}{2} 4.4=0$
$\mathrm{N}_{\mathrm{BC}}=7.21 \mathrm{kN}(\mathrm{C})$

$\sum \mathrm{F}_{\mathrm{x}}=0 \rightarrow-\frac{\sqrt{2}}{2} \mathrm{~N}_{\mathrm{AB}}+7.22+0.5=0$
$\mathrm{N}_{\mathrm{AB}}=10.9 \mathrm{kN}(\mathrm{T})$

$$
\begin{aligned}
& \sum \mathrm{F}_{\mathrm{y}}=0 \rightarrow \frac{\sqrt{2}}{2} 10.9+1-\mathrm{N}_{\mathrm{BD}}=0 \\
& \mathbf{N}_{\mathbf{B D}}=\mathbf{8 . 7} \mathbf{~ k N}(\mathbf{T})
\end{aligned}
$$

d) Maximum q at stretch $B D$

$$
\begin{aligned}
& \sum \mathrm{M}_{\mathrm{B}}=0 \rightarrow \mathrm{~F}_{\mathrm{A}} \cdot \mathrm{~L}-\frac{\mathrm{q}}{2}\left(\frac{\mathrm{~L}}{2}\right)\left(\frac{\mathrm{L}}{2}+\frac{2}{3} \frac{\mathrm{~L}}{2}\right)=0 \\
& \mathrm{~F}_{\mathrm{A}}=\frac{5 \mathrm{qL}}{24} \\
& \sum \mathrm{~F}_{\mathrm{y}}=0 \rightarrow \mathrm{~F}_{\mathrm{A}}+\mathrm{F}_{\mathrm{B}}=\frac{\mathrm{qL}}{4}
\end{aligned}
$$

$$
\mathrm{F}_{\mathrm{B}}=\frac{\mathrm{qL}}{24}
$$

$$
q(x)=q(1-x)
$$

$$
\mathrm{V}_{\mathrm{T}}(\mathrm{x})=\mathrm{q}\left(\mathrm{x}-\frac{\mathrm{x}^{2}}{2}\right)
$$

$M_{T}(x)=q\left(\frac{x^{2}}{2}-\frac{x^{3}}{6}\right)$
$\mathrm{V}(\mathrm{x})=\frac{5 \mathrm{q}}{24}-\mathrm{q}\left(\mathrm{x}-\frac{\mathrm{x}^{2}}{2}\right)=\frac{\mathrm{q}}{2}\left(\mathrm{x}^{2}-2 \mathrm{x}+0.833\right)$
$M(x)=\frac{5 q x}{24}-q\left(\frac{x^{2}}{2}-\frac{x^{3}}{6}\right)=\frac{q}{6}\left(x^{3}-3 x^{2}+2.5 x\right)$
$M_{\text {max }} \rightarrow \frac{d M(x)}{d x}=V(x)=0 \rightarrow x=0.59$

$M_{\text {max }}=M(x=0.59)=0.106 q=1 \mathrm{kN} . \mathrm{m}$
$\mathbf{q}=9.43 \mathrm{kN} / \mathrm{m}$
e) Safety coefficient.
$\sigma=\frac{\mathrm{N}}{\mathrm{A}}=\frac{10900}{\pi \cdot \mathrm{R}^{2}}=15.42 \mathrm{MPa}$
$\mathrm{SC}=\frac{\sigma_{\text {max }}}{\sigma_{\text {calculated }}}=\frac{150}{15.42}=\mathbf{9 . 7 2}$
